

GlowSpace

1. **Brand Identity:** The logo is centered to establish and reinforce the GlowSpace visual brand identity.
2. **Interactive Navigation:** Features three primary interactive buttons for seamless access to Marketing, Sales, and Customer Loyalty analytics.
3. **Smart User Experience:** Enhanced with Hover Tooltips that display a brief description of each page upon hovering, facilitating intuitive navigation and faster decision-making.
4. **Visual Intuition:** A modern design leveraging a consistent color palette (Black & Gold) to ensure a professional, cohesive, and user-friendly interface.

Marketing Overview

1. Top Key Performance Indicators (KPIs)

- **Total Revenue (\$311.71K):** Represents the gross financial value generated from all sales and services, serving as the primary indicator of the business's financial scale and growth.
- **Total Ad Spend (\$211.94K):** The total investment made across all marketing channels to reach potential customers and drive traffic to the business.

- **ROAS - Return on Ad Spend (1.47):** A critical efficiency metric that measures the revenue generated for every dollar spent on advertising, helping to evaluate the profitability of marketing efforts.
- **Total Conversions (11K):** The total number of successful actions or completed bookings, reflecting the overall volume of customer engagement and business activity.

2. Retention by Customer Type (Donut Chart)

- **Analysis:** Breakdown of the customer base between New and Returning clients.
 - **Insight:** The split is almost perfectly balanced (50.35% New vs. 49.65% Returning). This shows a healthy "acquisition engine" but suggests there is room to improve customer loyalty.
 - **Recommendation:** Implement a re-engagement email campaign or a loyalty discount for "New" customers to convert them into "Returning" ones, as retaining a customer is generally 5–25x cheaper than acquiring a new one.
-

3. ROAS by Marketing Channel (Bar Chart)

- **Analysis:** Comparing the effectiveness of different traffic sources.
- **Insight:** Google leads with a 1.50 ROAS, while Facebook and Local Ads lag at 1.45. Interestingly, Word of Mouth performs exceptionally well (1.48), proving that organic reputation is nearly as effective as paid Google ads.

- Recommendation: Reallocate a portion of the budget from Facebook to Google to capitalize on the higher intent. Additionally, incentivize "Word of Mouth" through a referral program.
-

4. Sum of Daily Revenue by Month (Area Chart)

- Analysis: Tracking revenue fluctuations over the 12-month fiscal cycle.
 - Insight: There is a significant performance peak in March, followed by a sharp decline in April and September. The end-of-year trend (October–December) shows a strong recovery.
 - Recommendation: Investigate the "March Peak" to identify if it was driven by a specific holiday or promotion. Use those findings to create a "Counter-September" campaign to bridge the revenue gap during the autumn slump.
-

5. CPC and Avg Rev Per Sale (Scatter Plot)

- Analysis: Correlation between Cost Per Click (CPC) and the average value of a sale.
- Insight: The most profitable sales (highest revenue ~160) occur when the CPC is lower (~\$18). As CPC increases toward \$21, the average revenue per sale actually drops, indicating that "expensive" clicks are not necessarily bringing in "high-value" customers.

- Recommendation: Set a "CPC Cap" on bidding strategies. Avoid overbidding for expensive keywords that result in lower-than-average sale values.
-

6. Slicers (Season & Service Category)

- Analysis: Dimensional filtering tools for Seasonality and Service types (Facial, Haircut, etc.).
- Insight: These allow for granular discovery of which services (e.g., Manicure) thrive in specific seasons (e.g., Summer).
- Recommendation: Use these filters to identify "underperforming services" in the "Off-Season." For example, if "Facials" drop in Winter, bundle them with a popular Winter service to maintain steady volume.

Sales & Revenue Analysis

helping to understand customer spending patterns and pricing effectiveness.

- Revenue Growth (\$27.50K): Measures the increase in revenue over a specific period, highlighting the business's ability to expand its income compared to previous benchmarks or goals.
- Total Transactions (2,000): The total count of individual sales or service interactions processed, reflecting the volume of customer traffic and operational throughput.

Insights from the Revenue Breakdown:

- Top Service: Facial services are the highest revenue driver, contributing \$80.31K (25.77%) of the total revenue.
 - Seasonal Peak: According to the Revenue Heatmap, the Fall season generated the highest total revenue across all categories, totaling \$83,315.37.
 - Top Marketing Channel: Google remains the strongest lead generator, contributing \$86K to the total revenue.
-

2. Sum of Daily Revenue by Service Category (Pie Chart)

- Analysis: Distribution of income across the four main service lines.
- Insight: Revenue is remarkably well-distributed. Haircut is the leader (26.86%), but even the lowest contributor, Hair Coloring (23.23%), is within a 4% margin of the leader.

- Recommendation: Since no single service dominates, the business is well-diversified. Focus on "Cross-Selling"—for example, offering a discount on a Manicure to everyone getting a Haircut to lift all categories simultaneously.
-

3. Revenue Heatmap (Matrix Table)

- Analysis: Cross-tabulation of service revenue by season (Fall, Spring, Summer, Winter).
 - Insight: Fall is the strongest season overall (\$83.3K), driven largely by Haircuts (\$24.3K). Winter is the weakest season (\$75.3K). Facials perform best in the fall, while Hair Coloring peaks in the summer.
 - Recommendation: Align marketing creative with these trends. Run "Winter Recovery" packages for Manicures and Facials to fill the revenue gap during the coldest months.
-

4. Sum of Daily Revenue by Year, Quarter, and Month (Line Chart)

- Analysis: Long-term revenue trend from May 2024 to May 2025.
- Insight: There is a concerning steep decline starting in March 2025, dropping toward zero by May 2025. The dashed trendline is also sloping downwards, indicating a gradual long-term decrease in daily revenue.
- Recommendation: URGENT: Investigate the data for Q2 2025. This drop could indicate a data reporting error, a major

competitor entry, or a loss of key staff. Immediate intervention is needed to reverse the downward trendline.

5. Sum of Daily Revenue by Marketing Channel (Bar Chart)

- Analysis: Total revenue generated per acquisition channel.
 - Insight: Google is the undisputed champion, generating \$86K. Word of Mouth (\$77K) outperforms both Local Ads (\$75K) and Facebook (\$74K).
 - Recommendation: Double down on Google Ads as it produces the highest volume. Since Word of Mouth is the second-best driver, consider a "Refer-a-Friend" program to capitalize on this organic momentum without increasing the ad budget.
-

6. Season Slicers

- Analysis: Interactive filters for specific months (January through July).
- Insight: These allow the user to zoom into specific monthly performance to see which service was the "hero" of that month.
- Recommendation: Use the March slicer to analyze what went right before the Q2 2025 crash, and use the April/May slicers to identify which specific services dropped off first during the decline.

Customer Insights & Retention

1. Top Key Performance Indicators (KPIs)

- **Total Customers (2000):** Represents the unique number of individuals who have utilized the business's services, indicating the total reach of the customer base.
- **Retention Rate (50%):** A vital loyalty metric showing the percentage of customers who return for additional services; it

reflects the business's ability to maintain long-term relationships.

- **Returning Customers (993):** The specific count of repeat clients, highlighting the strength of the existing customer community and brand loyalty.
 - **New Customers (1007):** The number of first-time clients acquired during the period, serving as a key indicator of successful market expansion and acquisition efforts.
-

Insights from Customer Dynamics:

- **Service Popularity:** Haircuts are the leading service for both customer types, generating the highest revenue at \$45K from New Customers and \$39K from Returning Customers.
 - **Acquisition Leader:** Google stands out as the most effective channel for growth, bringing in the highest volume of New Customers (approx. 275).
 - **Retention by Channel:** Local Ads show the highest efficiency in terms of customer loyalty, with a returning customer ratio of 53.07%.
-

2. Customer Type Per Date (Pie Chart)

- **Analysis:** Shows the overall proportion of customer segments.
- **Insight:** New Customers (50.35%) slightly edge out Returning Customers (49.65%). This confirms that the business is in a

growth phase, actively pulling in new traffic while maintaining its core base.

- Recommendation: Maintain the current acquisition spend, but ensure that the "New Customer" experience is flawless to prevent them from dropping off after the first visit.
-

3. ROAS by Marketing Channel and Customer Type (Stacked Bar Chart)

- Analysis: Compares how different channels attract new vs. returning customers.
 - Insight: Google is the most effective at attracting New Customers (54.10%). In contrast, Local Ads and Facebook skew more toward Returning Customers (~53% and ~52% respectively).
 - Recommendation: Use Google primarily for "Brand Awareness" and "Acquisition" campaigns. Use Facebook and Local Ads for "Retargeting" campaigns to bring existing customers back, as these channels seem to resonate more with people already familiar with the brand.
-

4. Sum of Daily Revenue by Service and Customer Type (Clustered Bar Chart)

- Analysis: Identifies which services appeal to which customer segment.

- Insight: Haircuts are the biggest driver for New Customers (\$45K). However, Facials and Manicures generate more revenue from Returning Customers (\$43K and \$39K, respectively).
 - Recommendation: Use "Haircut" deals as the "Lead Magnet" to get people in the door. Once they are in, "Upsell" them on Facials or Manicures, as these services appear to be the ones that build long-term loyalty.
-

5. New Customers and Sum of Daily Revenue by Marketing Channel (Bubble Chart)

- Analysis: Visualizes the volume of new customers vs. total revenue per channel.
 - Insight: Google is the clear winner, sitting at the top of the chart with the highest number of new customers (~275) and the highest revenue. Facebook is the lowest performer in both volume and revenue for new customer acquisition.
 - Recommendation: Consider shifting the budget away from Facebook and toward Google. The high position of Google suggests it has not yet hit "diminishing returns," meaning more investment there will likely lead to even more new customers.
-

6. Slicers (Date, Category, & Channel)

- Analysis: Global slicers to adjust the entire dashboard view.
- Insight: The date range is currently set from May 2024 to May 2025.

- Recommendation: Use the "Marketing Channel" filter to isolate "Word of Mouth." This will help you see which specific services (like Hair Coloring or Facials) are being recommended most by satisfied customers, allowing you to highlight those in your paid ads.
